Data transmission (also data communication or digital communications) is the transfer of data (a digital bitstream or a digitized analog signal) over a point-to-point or point-to-multipoint communication channel.Examples of such channels are copper wires, optical fibers, wireless communication channels, storage media and computer buses.The data are represented as an electromagnetic signal ...

Digital baseband transmission, also known as line coding, aims at transferring a digital bit stream over baseband channel, typically an unfiltered wire, contrary to passband transmission, also known as carrier-modulated transmission. Passband transmission makes communication possible over a bandpass filtered channel, such as the telephone network local-loop or a band-limited wireless channel.

In typical digital signal processing applications, there arises need to increase the sampling frequency of a signal sequence, where the higher sampling frequency is an integer multiple of the original sampling frequency i.e for a signal sequence with a sampling frequency , change the sampling frequency to , where is an integer.. Typically, upsampling by a factor of is done by inserting zeros ...

Figure 1: MSK as a special case of both non-linear and linear modulation schemes. At this point, you would be thinking about the following question: How can a modulation be both non-linear and linear? As we see later in this tutorial, originally MSK is a non-linear modulation but a certain depiction of its actual digital symbols known as pseudo-symbols turns it into an OQPSK representation.
