Image Correlation for Shape, Motion and Deformation

Image Correlation for Shape, Motion and Deformation Measurements provides a comprehensive overview of
data extraction through image analysis. Readers will find and in-depth look into various single- and
multi-camera models (2D-DIC and 3D-DIC), two- and three-dimensional computer vision, and volumetric
digital image correlation (VDIC).

Image Correlation for Shape, Motion and Deformation

The essential concepts underlying the use of two-dimensional (2-D) digital image correlation for deformation
measurements and three-dimensional (3-D) digital image correlation for shape and deformation
measurements on curved or planar specimens are presented.

Image Correlation for Shape, Motion and Deformation

Development in digital image correlation (DIC) [1,2] in the last thirty years has made it a popular and powerful
technique for full-field motion, deformation and shape measurement. As a typical non-interferometric optical
metrology with distinct advantages of simple experimental set-up, low-requirement on experimental

Digital Image Correlation - ScienceDirect

Digital Image Correlation (DIC) is a robust non-contact technique for measuring material deformation [1–3]. DIC uses image registration algorithms to track the relative displacements of material points between a reference (typically, the undeformed) image and a current (typically, the deformed) image [4, 5].
